PDGL Ü2

1) Bestimmen Sie Mengen $\subseteq \mathbb{R}^2$, wo die PDGL elliptisch, parabolisch oder hyperbolisch sind:

(i) $x u_{xx} + 6 u_{xy} + (x+y) u_{yy} + x^2 y u_x = \cosh(x)$

$a = x \quad b = 3 \quad c = x+y \quad f = \cosh(x) - x^2 y u_x$

$b^2 - ac = 3^2 - x(x+y) = 9 - x^2 - xy$

parabolisch: $9 - x^2 - xy = 0 \iff xy = 9 - x^2 \iff x \neq 0 \wedge y = \frac{9-x^2}{x}$

$\{(x,y) \in \mathbb{R}^2 : x \neq 0, y = \frac{9-x^2}{x}\}$

elliptisch: $9 - x^2 - xy < 0 \iff xy > 9 - x^2 \iff (x > 0 \wedge y > \frac{9-x^2}{x}) \vee (x < 0 \wedge y < \frac{9-x^2}{x})$

$\{(x,y) \in \mathbb{R}^2 : x > 0, y > \frac{9-x^2}{x}\} \cup \{(x,y) \in \mathbb{R}^2 : x < 0, y < \frac{9-x^2}{x}\}$

hyperbolisch: $9 - x^2 - xy > 0 \iff xy < 9 - x^2 \iff (x > 0 \wedge y < \frac{9-x^2}{x}) \vee (x < 0 \wedge y > \frac{9-x^2}{x})$

$\{(x,y) \in \mathbb{R}^2 : x > 0, y < \frac{9-x^2}{x}\} \cup \{(x,y) \in \mathbb{R}^2 : x < 0, y > \frac{9-x^2}{x}\}$

(ii) $(7x^2 - \pi y^2) u_{xx} + 4\pi x^2 u_{xy} + y^2 u_{yy} - u^2 u_x - \sqrt{2}\, x = e^{2\pi x}$

$a = 7x^2 - \pi y^2 \quad b = 2\pi x^2 \quad c = y^2 \quad f = e^{2\pi x} + u^2 u_x + \sqrt{2}\, x$

$b^2 - ac = 4\pi^2 x^4 - (7x^2 - \pi y^2) y^2 = 4\pi^2 x^4 - 7x^2 y^2 + \pi y^4$

parabolisch: $4\pi^2 x^4 - 7x^2 y^2 + \pi y^4 = 0 \iff y^2 = \frac{7x^2 \pm \sqrt{49x^4 - 4\pi 4\pi^2 x^4}}{2\pi} = \frac{7x^2 \pm \sqrt{49 - 16\pi^3}\, x^2}{2\pi}$

da wir in $\mathbb{R}^2$ suchen und $49 - 16\pi^3 < 0$ gibt es nur die $(0,0)$ Lösung $\{(0,0)\}$

elliptisch: $4\pi^2 x^4 - 7x^2 y^2 + \pi y^4 < 0$ hat keine Lösungen, da die parabolischen und hyperbolischen schon ganz $\mathbb{R}^2$ sind (wie wir gleich sehen werden) $\emptyset$

hyperbolisch $4\pi^2 x^4 - 7x^2 y^2 + \pi y^4 > 0 \iff \binom{x}{y} \neq \binom{0}{0}$, da stetig von x,y. Für $x = y = 0$ wie oben gesehen parabolisch und für etwa $x = y = 1$ ist der Ausdruck gleich $4\pi^2 - 7 + \pi > 4 \cdot 3^2 - 7 + 3 = 36 - 7 + 3 = 32 > 0$. Aus der Stetigkeit folgt

$\{(x,y) \in \mathbb{R}^2 : \binom{x}{y} \neq \binom{0}{0}\}$

$\square$

Def $a u_{xx} + 2b u_{xy} + c u_{yy} = f$

$b^2 - ac < 0$ an (x,y) so ist die PDGL dort elliptisch

$b^2 - ac > 0$ — " — hyperbolisch

$b^2 - ac = 0$ — " — parabolisch
